Check out [Cycle2](#), the latest in the Cycle line of slideshows.

## Overview

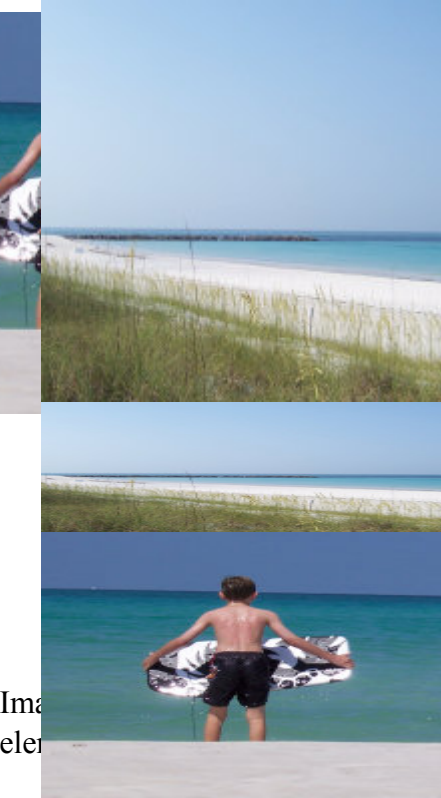

The jQuery Cycle Plugin is a slideshow plugin that supports many different types of transition effects. It supports pause-on-hover, auto-stop, auto-fit, before/after callbacks, click triggers and much more. It also supports, but does not require, the [Easing Plugin](#)

## How it Works

The plugin provides a method called `cycle` which is invoked on a container element. Each child element of the container becomes a "slide". Options control how and when the slides are transitioned.

## Demos

shuffle

zoom

```
$('#zoom').cycle({
  fx:      'zoom',
  speed:   false,
  delay:   5000
});
```

fade

```
$('#fade').cycle();
```

```
$('#right').cycle({
  fx:      'scrollRight',
  next:    '#right',
  timeout: 0,
  easing:  'easeInOutBack'
});
```

## Browse Effects

Use the [Effects Browser](#) page to preview the available effects.

# Options

The Cycle Plugin provides many options for customizing your slides. The default option values can be overridden by passing an option object to the `cycle` method, by using metadata on the container element, or by redefining the value in your own code.

For more about options, see the [Options Reference](#) page.
